Intuitive solution

Single objective optimization problem with **computationally intensive** black-box

$$\begin{array}{ll}\min & f(z) \\ \text{w.r.t.} & z \\ & z_{\min} \leq z \leq z_{\max}\end{array}$$

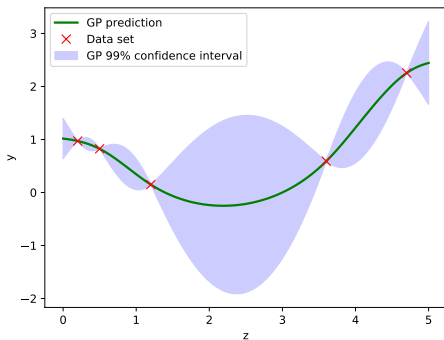

Where is the minimum of $f(\cdot)$?
Where should be the next evaluation ?

Intuitive solution II

Use of **Bayesian Optimization** (BO):

- ▶ the objective function is model with a Gaussian Process (GP),
- ▶ an **infill criterion** is used to decide where should be the next evaluation

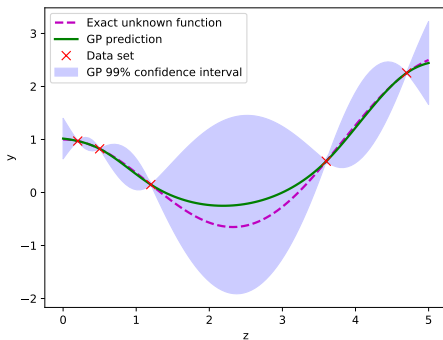

Where is the minimum of $f(\cdot)$?
Where should be the next evaluation ?

Gaussian process [Rasmussen and Williams, 2006]

A Gaussian Process is used to describe a distribution over function. It is a collection of infinite random variables, **any finite number of which have a joint Gaussian distribution**.

It is defined by its mean function and covariance function (Kernel):

$$F(\cdot) \sim \mathcal{GP}(\mu(\cdot), k^\Theta(\cdot, \cdot))$$

Multi-objective
case

Conclusions

This step of BO consists in performing a simultaneous search for the **problem optimum** and **refinement** of the GP modeling the objective function by determining the location in the design space at which the problem optimum is most likely to be found according to a given **acquisition function**.

The **infill criteria** should do the following operations:

- ▶ **Exploration** for more accurate learning → reduce the uncertainty in the model,
- ▶ **Exploitation/optimization** for better results → minimize the loss in a sequence z_1, \dots, z_n .

A first naive criterion

Use of mean prediction of GP:

$$m(\mathbf{z}) = -\hat{f}(\mathbf{z})$$

- ▶ does not exploit the uncertainty prediction given by GP,
- ▶ exploitation only.

Let's see in the following three alternative criteria:

- ▶ Upper (lower) confidence band,
- ▶ Probability of improvement (PI),
- ▶ Expected improvement (EI).

Upper (lower) Confidence Band

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

Considering the objective function modeled by a GP such that:
 $F(\cdot) \sim \mathcal{GP}(\mu(\cdot), k^\Theta(\cdot, \cdot)).$

$$\text{LCB}(\mathbf{z}) = -\hat{f}(\mathbf{z}) + \beta \hat{s}(\mathbf{z})$$

$\hat{f}(\mathbf{z})$ the mean GP prediction and $\hat{s}(\mathbf{z})$ the standard deviation of the objective function prediction and β a fixed parameter.

To identify the next data point that should be evaluated on the exact objective function and added to the current DoE, the following optimization problem is solved:

$$\max_{\mathbf{z}} \text{LCB}(\mathbf{z}) \quad (1)$$

This problem is computationally non-expensive as it involves only the GP of the objective function.

Analysis of this infill criterion:

- allows to take into account the uncertainty in a static way.

Context

Intro to BO

Infill Criteria

Constrained case

Multi-objective
case

Conclusions

Probability of Improvement (PI)

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

The **improvement** from the current samples $y_{\min} = \min\{y_{(1)}, \dots, y_{(n)}\}$ is defined as follows [Forrester et al., 2008]:

$$I(z) = \max(y_{\min} - F(z), 0) = \begin{cases} y_{\min} - F(z), & F(z) < y_{\min} \\ 0, & \text{otherwise} \end{cases}.$$

The **Probability of Improvement** (PI) is defined as the probability that $F(z) \leq y_{\min}$,

$$\begin{aligned} \text{PI}(z) &= \mathbb{P}[F(z) \leq y_{\min}] = \frac{1}{\hat{s}(z)\sqrt{2\pi}} \int_{-\infty}^{y_{\min}} \exp\left(\frac{-(t - \hat{f}(z))^2}{2\hat{s}(z)^2}\right) dt \\ \text{PI}(z) &= \Phi\left(\frac{y_{\min} - \hat{f}(z)}{\hat{s}(z)}\right), \end{aligned}$$

with $\Phi(\cdot)$ the Cumulative Density Function of the Normal distribution, $\hat{f}(z)$ the mean GP prediction and $\hat{s}(z)$ the standard deviation of the objective function prediction.

Context

Intro to BO

Infill Criteria

Constrained case

Multi-objective
case

Conclusions

Probability of Improvement (PI)

The Probability of Improvement (PI) is defined as the probability that $F(z) \leq y_{\min}$,

$$\text{PI}(z) = \Phi \left(\frac{y_{\min} - \hat{f}(z)}{\hat{s}(z)} \right),$$

To identify the next data point that should be evaluated on the exact objective function and added to the current DoE, the following optimization problem is solved:

$$\max_z \text{PI}(z) \quad (2)$$

This problem is computationally non-expensive as it involves only the GP of the objective function.

Analysis of this infill criterion:

- ▶ data points proposed by PI are often located near the current best point where the probability is high,
- ▶ not relevant criterion for global exploration.

Expected Improvement [Jones et al., 1998]

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

Improvement:

$$I(z) = \max(y_{\min} - F(z), 0.)$$

Mathematical expectation of Improvement is given by:

$$EI(z) = \mathbb{E}[\max(y_{\min} - F(z), 0.)]$$

$$EI(z) = \left(y_{\min} - \hat{f}(z)\right) \Phi\left(\frac{y_{\min} - \hat{f}(z)}{\hat{s}(z)}\right) + \hat{s}(z) \phi\left(\frac{y_{\min} - \hat{f}(z)}{\hat{s}(z)}\right)$$

Two parts in the sum:

- **first**: exploitation of zone in the search space in which there is potential improvement of the function (scaled by discrepancy between the prediction and the current minimum).
- **second**: exploration of the zones for which the uncertainty of the model is high ($\phi(\cdot)$ the PDF of the Normal distribution).

→ **The expected improvement allows to balance the part relative to exploration and the part dedicated to exploitation in the refinement criterion. It is the most used infill criterion in the literature.**

Conclusions

Which criterion?

Let consider the following function:

$$f(z) = 0.4 \sin(10z) + 0.5z^2 - 0.2z + 0.4z^3 + 0.4$$

defined in $[0., 1.]$. Only 4 samples of this function are available at $z = 0.15$, $z = 0.32$, $z = 0.75$ and $z = 0.95$.

Which criterion?

Let consider the following function:

$$f(z) = 0.4 \sin(10z) + 0.5z^2 - 0.2z + 0.4z^3 + 0.4$$

defined in $[0., 1.]$. Only 4 samples of this function are available at $z = 0.15$, $z = 0.32$, $z = 0.75$ and $z = 0.95$.

Which criterion?

Let consider the following function:

$$f(z) = 0.4 \sin(10z) + 0.5z^2 - 0.2z + 0.4z^3 + 0.4$$

defined in $[0., 1.]$. Only 4 samples of this function are available at $z = 0.15$, $z = 0.32$, $z = 0.75$ and $z = 0.95$.

Conclusions

Optimization of infill criterion - bottlenecks

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

- In the same way as the likelihood in the training phase of GP, infill criteria often present a lot of local minima (especially in multi dimensional case)
- Infill criteria present large areas with null value.

→ Need to use either multi-start gradient based optimization or global exploration algorithms (e.g. CMA-ES, Genetic algorithms, see lecture 1).

Constrained case

$$\begin{array}{ll}\min & f(z) \\ \text{w.r.t.} & z \\ \text{s.t.} & g_i(z) \leq 0 \quad i = 1, \dots, n_c \\ & z_{\min} \leq z \leq z_{\max}\end{array}$$

How to take into account the constraint functions in addition to the objective function in a Bayesian Optimization framework ?

General ideas:

- ▶ Create a GP surrogate model for each constraint function in addition to the GP of the objective function,
- ▶ Incorporate the information of the GPs of the constraints into the infill criteria

In the following, two infill criterion adapted to the presence of constraint are introduced.

Direct approach - constrained EI

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

Context

Intro to BO

Infill Criteria

Constrained case

Multi-objective
case

Conclusions

$$\begin{array}{ll}\min & f(\mathbf{z}) \\ \text{w.r.t.} & \mathbf{z} \\ \text{s.t.} & \hat{g}_i(\mathbf{z}) \leq 0 \quad i = 1, \dots, n_c \\ & \mathbf{z}_{\min} \leq \mathbf{z} \leq \mathbf{z}_{\max}\end{array}$$

where $\hat{g}_i(\cdot)$ is the mean approximation of constraint i .

It is a naive approach as the information on the uncertainty associated to the constraint is not taken into account.

Probability of feasibility

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

The probability of feasibility is defined as the probability that all the constraints are satisfied.

$$P_f(\mathbf{z}) = \prod_{i=1}^{n_c} \mathbb{P}(G_i(\mathbf{z}) \leq 0)$$

with $G_i \sim \mathcal{N}(\hat{g}_i, \hat{s}_i)$

$$\mathbb{P}(G_i(\mathbf{z}) \leq 0) = \Phi\left(-\frac{\hat{g}_i(\mathbf{z})}{\hat{s}_i(\mathbf{z})}\right)$$

Variance of the prediction

Context

Intro to BO

Infill Criteria

Constrained case

Multi-objective
case

Conclusions

Probability of feasibility

The probability of feasibility is defined as the probability that all the constraints are satisfied.

$$P_f(\mathbf{z}) = \prod_{i=1}^{n_c} \mathbb{P}(G_i(\mathbf{z}) \leq 0)$$

with $G_i \sim \mathcal{N}(\hat{g}_i, \hat{s}_i)$

$$\mathbb{P}(G_i(\mathbf{z}) \leq 0) = \Phi\left(-\frac{\hat{g}_i(\mathbf{z})}{\hat{s}_i(\mathbf{z})}\right)$$

Probability of feasibility

In order to take into account the probability of feasibility into the infill criteria, the following infill optimization problem is solved (using the EI criteria for the objective function) :

$$\begin{array}{ll} \max & EI(z) \times \prod_{i=1}^{n_c} \mathbb{P}(G_i(z) < 0) \\ \text{w.r.t.} & z \\ & z_{\min} \leq z \leq z_{\max} \end{array}$$

Probability of feasibility

In order to take into account the probability of feasibility into the infill criteria, the following infill optimization problem is solved (using the EI criteria for the objective function) :

$$\begin{array}{ll} \max & EI(\mathbf{z}) \times \prod_{i=1}^{n_c} \mathbb{P}(G_i(\mathbf{z}) < 0) \\ \text{w.r.t.} & \mathbf{z} \\ & \mathbf{z}_{\min} \leq \mathbf{z} \leq \mathbf{z}_{\max} \end{array}$$

- ▶ the infill criterion is close to zero in the areas where there is a very low probability of feasibility,
- ▶ if the number of constraints increases, the probability of feasibility is null in the entire space that makes difficult the optimization problem solving,
- ▶ uses of non constrained optimization algorithms.

Expected violation

MDO, application
to space vehicle
design

M. Balesdent, L.
Brevault

Context

Intro to BO

Infill Criteria

Constrained case

Multi-objective
case

Conclusions

- ▶ The expected violation expresses the mathematical expectation of the constraint violation,
- ▶ Similar to EI adapted to the constraint.

$$\begin{aligned}EV_i(\mathbf{z}) &= \mathbb{E}[\max(G_i(\mathbf{z}) - 0, 0)] \\&= (\hat{g}_i(\mathbf{z}) - 0)\Phi\left(\frac{\hat{g}_i(\mathbf{z}) - 0}{\hat{s}_{g_i}(\mathbf{z})}\right) + \hat{s}_{g_i}(\mathbf{z})\phi\left(\frac{\hat{g}_i(\mathbf{z}) - 0}{\hat{s}_{g_i}(\mathbf{z})}\right)\end{aligned}$$

Multi-objective infill criterion

Hypervolume indicator

The hypervolume indicator expresses the hypervolume of the objective space dominated by the approximated Pareto set.

$$H_{\mathcal{Y}_N} = \left\{ \mathbf{y} \in \mathbb{B}; \exists i \in \{1, \dots, N\}, \mathbf{y}^{(i)} \prec \mathbf{y} \right\}$$

With $\mathbb{B} = \{\mathbf{y} \in \mathbb{R}^n; \mathbf{y}^L \leq \mathbf{y} \leq \mathbf{y}^U\}$ where \mathbf{y}^L is the ideal point ($\mathbf{y}^L = [\min f_1(\mathbf{z}), \dots, \min f_n(\mathbf{z})]$) and \mathbf{y}^U a chosen upper bound (Nadir point)

Multi-objective infill criterion

Hypervolume improvement

[Bradstreet et al., 2006]

The **hypervolume improvement** is the improvement of the hypervolume by adding a candidate to the data set

$$I_N(\mathbf{z}^{(N+1)}) = |H_{\mathcal{Y}_{N+1}}| - |H_{\mathcal{Y}_N}|$$

Expected Hypervolume improvement

[Emmerich et al., 2016]

The **expected hypervolume improvement** is the mathematical expected improvement of the hypervolume by adding a candidate to the sample

$$\begin{aligned}EHVI_N(\mathbf{z}) &= \mathbb{E}(|H_{\mathcal{Y}_{N+1}}| - |H_{\mathcal{Y}_N}|) \\ &= \int_{\mathbb{R} \setminus H_{\mathcal{Y}_N}} \mathbb{P}(\mathbf{Y}^{*(N+1)} \prec p) dp\end{aligned}$$

with $\mathbf{Y}^{*(N+1)} = [Y_1^{*(N+1)}, Y_2^{*(N+1)}]$

and $Y_1^{*(N+1)} \sim \mathcal{N}(\hat{y}_1^{*(N+1)}, \hat{s}_1^{*(N+1)})$ and

$Y_2^{*(N+1)} \sim \mathcal{N}(\hat{y}_2^{*(N+1)}, \hat{s}_2^{*(N+1)})$

Conclusions

How to compute the EHVI in the two objective case (at iteration N):

- ▶ Partition the $\mathbb{B} \setminus H_{Y_N}$ into r rectangles,
- ▶ Use this decomposition to facilitate the integration over the points that can be dominated by $Y(z)$.

$$\begin{aligned}
 EHVI(z) &= \int_{P \in \mathbb{B} \setminus H_N} \mathbb{P}(Y(z) \prec p) dp \\
 &= \int \int_{p=(p_1, p_2) \in \mathbb{B} \setminus H_N} \mathbb{P}(Y_1(z) \prec p_1) \mathbb{P}(Y_2(z) \prec p_2) dp_1 dp_2 \\
 &= \sum_{t=0}^{r+1} \int_{y'_1(t-1)}^{y'_1(t)} \mathbb{P}(Y_1(z) \prec p_1) \int_{y'_2(0)}^{y'_2(t-1)} \mathbb{P}(Y_2(z) \prec p_2) dp_1 dp_2 \\
 &= \sum_{t=0}^{r+1} \int_{y'_1(t-1)}^{y'_1(t)} \Phi\left(\frac{p_1 - \hat{y}_1(z)}{\hat{\sigma}_1(z)}\right) \int_{y'_2(0)}^{y'_2(t-1)} \Phi\left(\frac{p_2 - \hat{y}_2(z)}{\hat{\sigma}_2(z)}\right) dp_1 dp_2
 \end{aligned}$$

Multi-objective
case

Conclusions

- Computation of EHVI in high dimension (> 2) is much more difficult.

Constrained multi-objective computation

Expected hypervolume improvement can be associated respectively with either Expected Violation or Probability of Feasibility for constrained optimization problem.

EHVI with EV

$$\begin{array}{ll}\max & EHVI(z) \\ \text{w.r.t.} & z \\ \text{s.t.} & EV_i(z) \leq t_i \quad \text{for } i = 1, \dots, n_c \\ & z_{\min} \leq z \leq z_{\max}\end{array}$$

EHVI with PoF

$$\begin{array}{ll}\max & EHVI(z) \times \prod_{i=1}^{n_c} \mathbb{P}(G_i(z) < 0) \\ \text{w.r.t.} & z \\ \text{s.t.} & z_{\min} \leq z \leq z_{\max}\end{array}$$

Conclusions

Conclusions

Bayesian Optimization allows to optimize computationally intensive problems using GP models for the objective and constraint functions.

- ▶ Two key elements: the **surrogate model** and the **acquisition function** (infill criterion).
- ▶ The key is to find a good balance between **exploration** and **exploitation** of the minimum in the search.
- ▶ The curse of dimension is very important in Bayesian Optimization. In more than 10 dimensions problems, alternative approaches to GP (for instance combining GP and dimension reduction techniques) are more suited.

A lot of toolboxes implement Bayesian Optimization methods in python:

- ▶ Surrogate Toolbox Modeling (SMT)

- ▶ <https://smt.readthedocs.io/en/latest/>

- ▶ scikit-learn
